

Intelligent Sales Forecasting

Executive Business Report

Date: July 2026

1. Executive Summary

This report presents the findings of our comprehensive retail demand intelligence system, designed to optimize our supply chain and inventory decisions. By analyzing four years of daily sales data and applying industry-standard forecasting algorithms, we have modeled upcoming customer demand, detected unusual historical purchase spikes, and segmented our product catalog by buying behavior. This data-driven approach will allow us to confidently reduce overstock waste while ensuring we meet upcoming sales demand.

2. Key Findings from EDA & Forecasting

- **Category Dominance:** Technology generated the highest total revenue (\$836k) among all categories.
- **Regional Consistency:** The West region demonstrated the most consistent year-over-year sales growth with the lowest volatility.
- **Predictable Seasonality:** Demand drops sharply in early Q1 but consistently surges in Q4 across all four historical years. The **Prophet** model proved to be the most accurate at capturing this behavior.

3. Predictive 3-Month Sales Forecast

Prophet Model Forecast (Jan 2018 - Mar 2018)

Based on our best-performing model, here is the projected baseline sales volume for the next quarter, including a standard confidence range (margin of error):

- **Month 1 (January):** \$52,929 expected (Likely range: \$32,060 to \$73,797) - Post-holiday stabilization.
- **Month 2 (February):** \$35,122 expected (Likely range: \$14,253 to \$55,990) - Lowest baseline demand month.
- **Month 3 (March):** \$71,212 expected (Likely range: \$50,344 to \$92,080) - Gradual upward spring demand curve.

4. Top 3 Demand Anomalies Detected

Using Z-Score statistical anomaly detection, we flagged the most severe deviations from expected weekly sales patterns. The top 3 anomalies are:

- **Week of March 23, 2014 (\$38,176 in sales):** Unexpectedly high spike, likely caused by an aggressive early-year promotional campaign.
- **Week of March 26, 2017 (\$27,125 in sales):** Major surge, likely reflecting a heavy end-of-quarter clearance push.
- **Week of August 30, 2015 (\$14,751 in sales):** Sharp spike correlating with a late-summer / back-to-school rush.

5. Product Demand Segments & Inventory Strategy

Our product catalog was clustered into 4 distinct groups based on Volume, Volatility, YoY Growth, and Average Order Value.

Segment Profile	Recommended Stocking Strategy
High Volume, Stable Demand	Maintain high safety stock; negotiate bulk pricing contracts with suppliers.
Low Volume, High Volatility	Adopt a Just-in-Time (JIT) model; order on-demand to free up capital.
Growing Demand	Incrementally increase stock month-over-month; allocate prime shelf-space.
Declining Demand	Halt new procurement; implement aggressive clearance promotions.

6. Strategic Business Recommendations

- **1. Expand Technology Category Budget:** Because the Technology category yields the highest overall revenue (\$836k) and correlates heavily with strong macro tech markets, we should increase its procurement budget to capture more of this high-value market share.
- **2. Prioritize West Region Expansion:** The West region shows the lowest year-over-year volatility and the highest baseline sales. We should prioritize capital expenditure for warehouse expansion and marketing exclusively in the West region.
- **3. Restructure Q1 Inventory Cycles:** While Q1 generally sees a massive drop in demand (e.g., February expected at \$35k), our anomaly detection shows massive, unexpected spikes consistently occurring in late March (2014 & 2017). We must prep late-Q1 inventory to handle these aggressive clearance surges.

7. System Risks & Limitations

Limitation: The current forecasting system relies purely on historical auto-correlation (past sales predicting future sales). It cannot preemptively forecast external shocks (such as supply chain disruptions, unannounced competitor sales, or severe macroeconomic downturns) without the manual addition of external regression variables.
